

Abstract and proposal for presentation at the 17th European Industrial Hemp Conference

The potential of utilising Hemp Building materials to address Climate Change

Steve Allin director of the International Hemp Building Association & Consultant

As humanity struggles to find ways to address seriously the potential disastrous effects of Climate Change, the use of Hemp Building materials in a new system and with a new understanding of energy usage and behaviour is proving that we can do that with great impact. Many different approaches have proved successful in achieving net zero homes worth in the creation of the materials and the usage of the buildings afterwards. Examples will be given of a variety of designs and manufacturing processes to achieve these worthy goals.
