# National Plant System Hemp Germplasm Repository: Developing resources to serve the global hemp community Zachary Stansell

Hemp germplasm collection at PGRU

- Understand & contextualize hemp germplasm research, breeding, and conservation.
- Acquisition, documentation, preservation, distribution, & evaluation of diverse genetic resources to breeders+researchers
- Capture and distribute novel phenomic data, genomic resources, and scientific tools

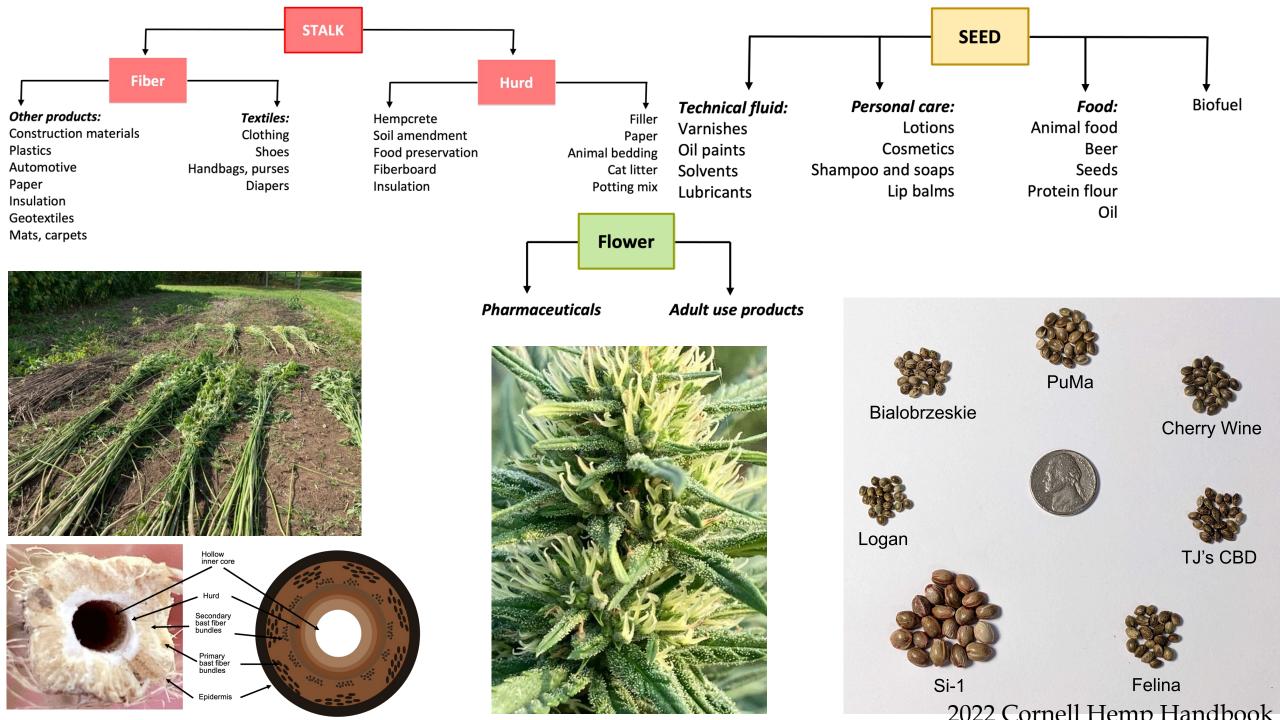

What is hemp?

## Cannabis sativa

- < 0.3% THC
- Dioecious
- Diploid (2n=20x)
- Short-day
- Multipurpose

## Plant Sex:

Female (left), male (center) and monoecious (right)

# Hemp Genetic Diversity

Hemp is no stranger to the Genebanks!

947. BETULA DAVURICA (?).

Birch.

From Nertchinsk, Siberia. Received through Prof. N. E. Hansen, May 24, 1898. Collected by Mr. Roborovsky. (4 packages.)

948. CANNABIS SATIVA.

Hemp.

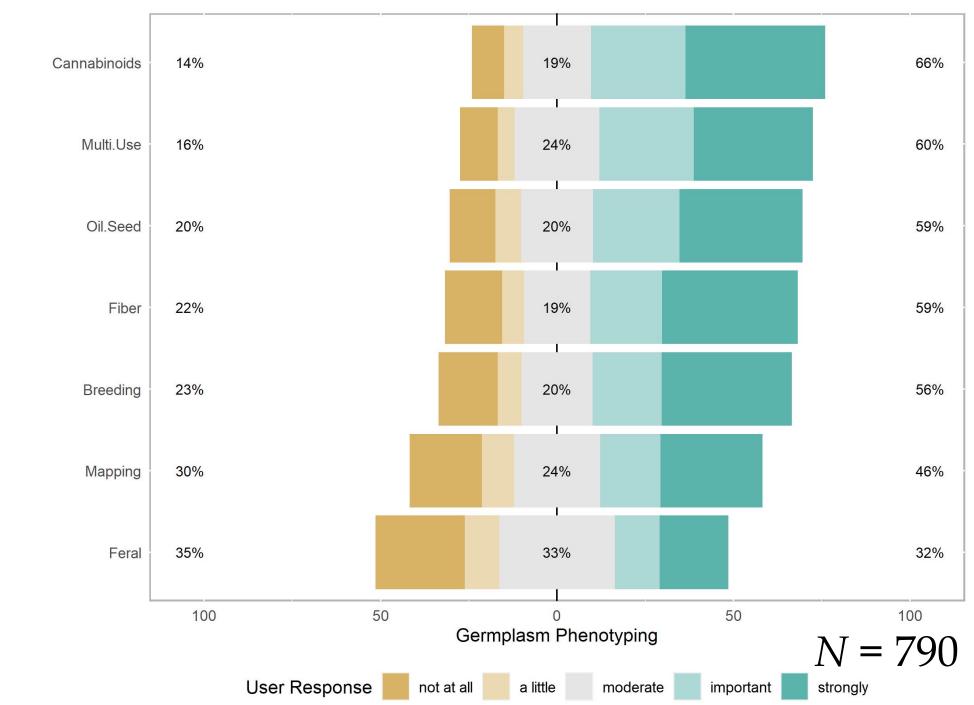

From Nertchinsk, Siberia. Received through Prof. N. E. Hansen, May 24, 1898. Collected by Mr. Roborovsky. (3 packages.)

949. TAGETES.

Marigold.

From Nertchinsk, Siberia. Received through Prof. N. E. Hansen, May 24, 1898. Collected by Mr. Roborovsky. (3 packages.)

# Germplasm Stakeholder Survey

USDA Hemp Germplasm Stakeholder Survey 2022

# Status

# Hemp Germplasm Repository Status

- Hired hemp breeder, Tyler Gordon (2022)
- Collected ~180 accessions + germplasm increase
- Developed phenotyping handbook
- Phenotyping efforts underway (Field, GH, GC)
- Established 6 phenotyping collaborations
- Working closely with many stakeholders to develop a **common** genotyping platform.

#### **ABOUT**

This text compiles methods and protocols used by the hemp community to characterize, evaluate, and describe he and these characters have been identified as important or useful to conserve, describe, identify, or improve germ and reliable data describing hemp germ will empower conservation of hemp germ genetic diversity and selection unique phenotypes for breeding programs.

Specifically, this handbook was undertaken with the following objectives:

### USDA Hemp Descriptor and Phenotyping Handbook

Zachary Stansell, Anya Osatuke 14-Jul-2021

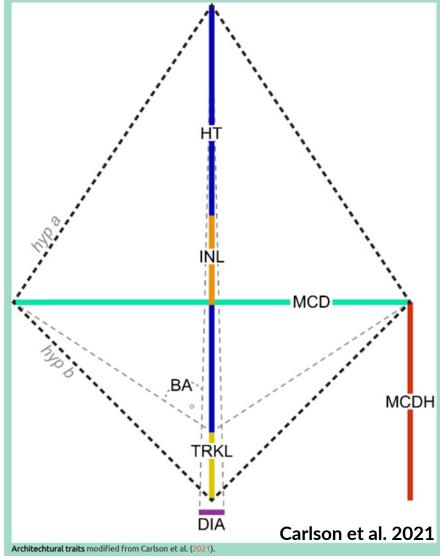

#### **ABOUT**

This text compiles methods and protocols used by the hemp community to characterize, evaluate, and describe  $h\epsilon$ and these characters have been identified as important or useful to conserve, describe, identify, or improve germ and reliable data describing hemp germplasm will empower conservation of hemp genetic diversity and selection unique phenotypes for breeding programs.

Specifically, this handbook was undertaken with the following objectives:

#### Morphology

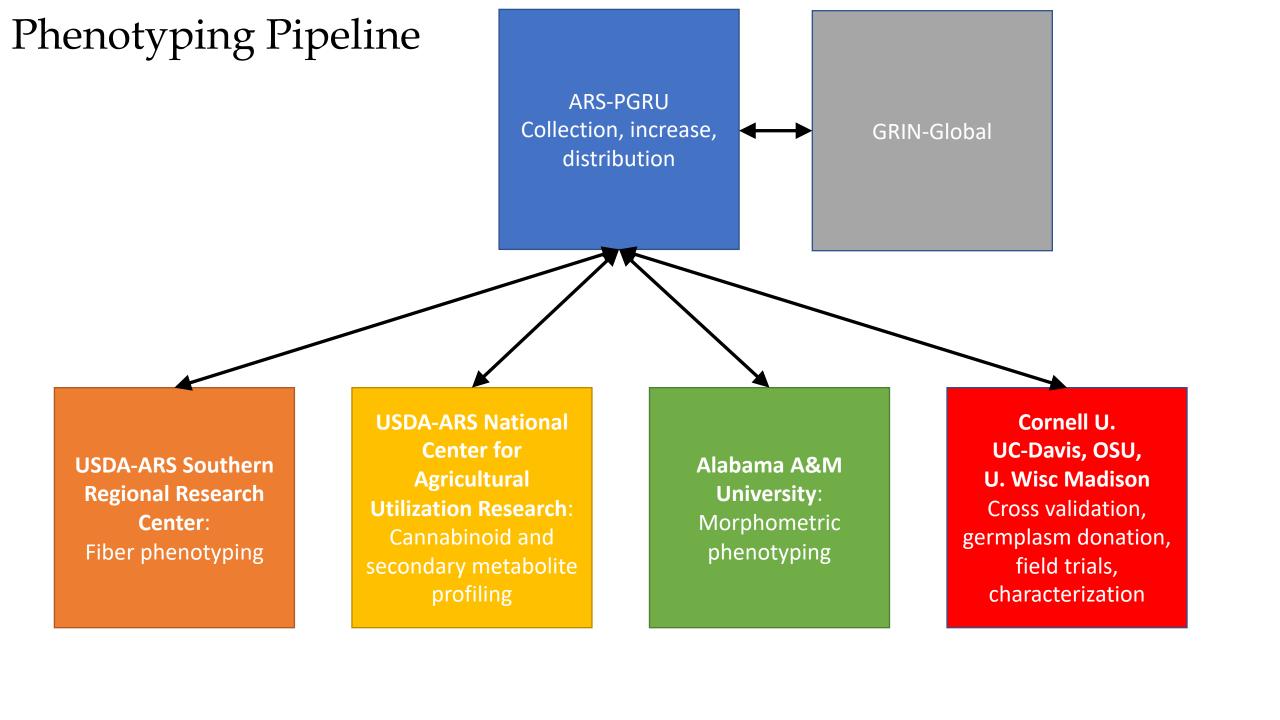

Maximum canopy diameter as width of plant at widest set of branches, see Carlson et al. (2021)). Measured from widest tip to tip without stretching branches. Include flowering tissue in measurement.

Height at maximum canopy diameter from ground to tip of primary stem, see Carlson et al. (2021).

Trunk length is evaluated as distance from ground to first branch. See Carlson et al. (2021).

Internode length is calcualted by counting the number of branching pairs along 50 cm of the primary stem in the middle of

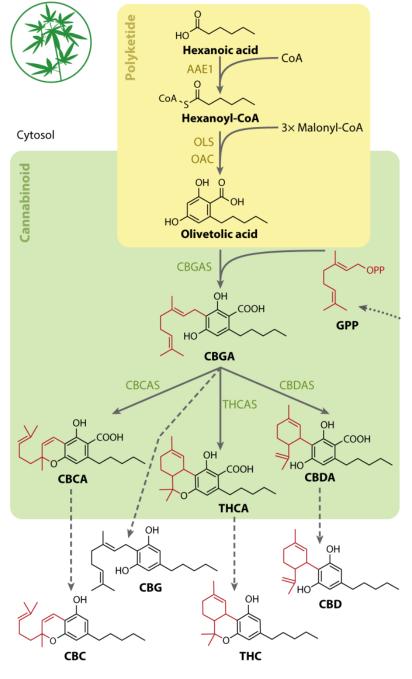

# Biology

# The Hot Hemp Question 😲

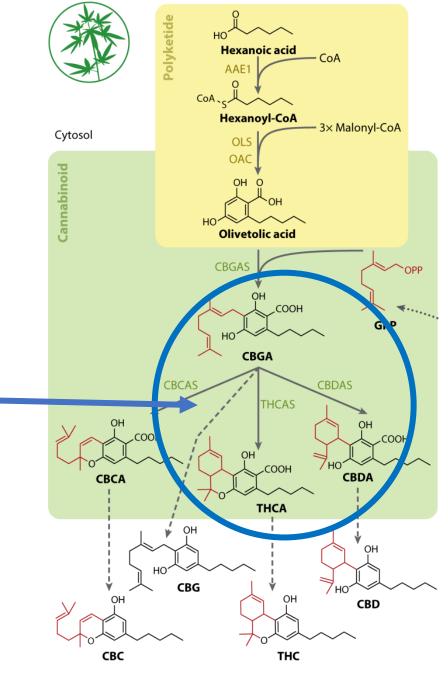

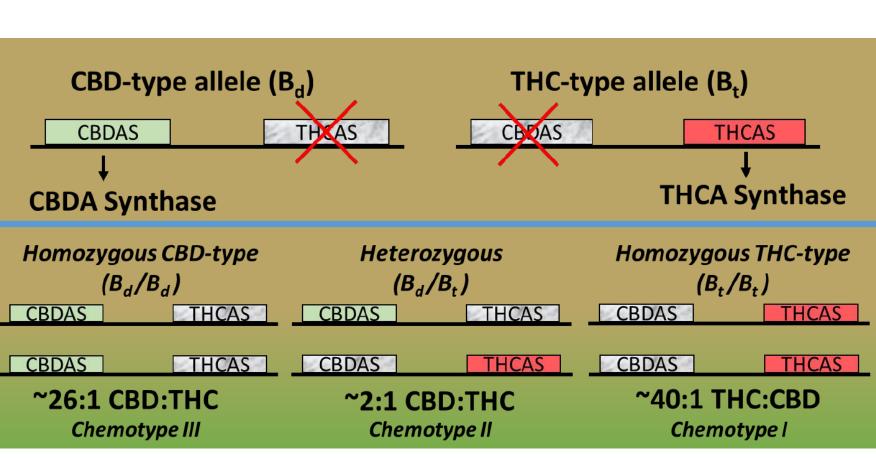

# Cannabinoid biosynthesis

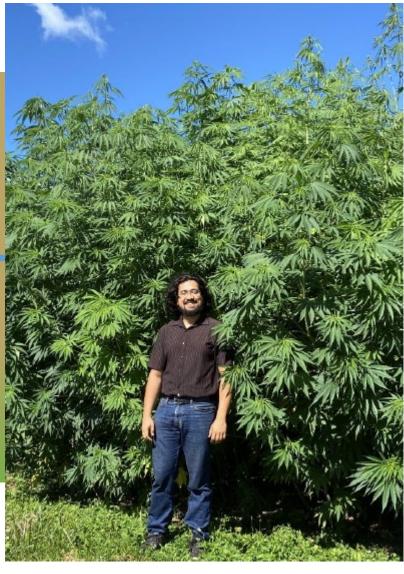

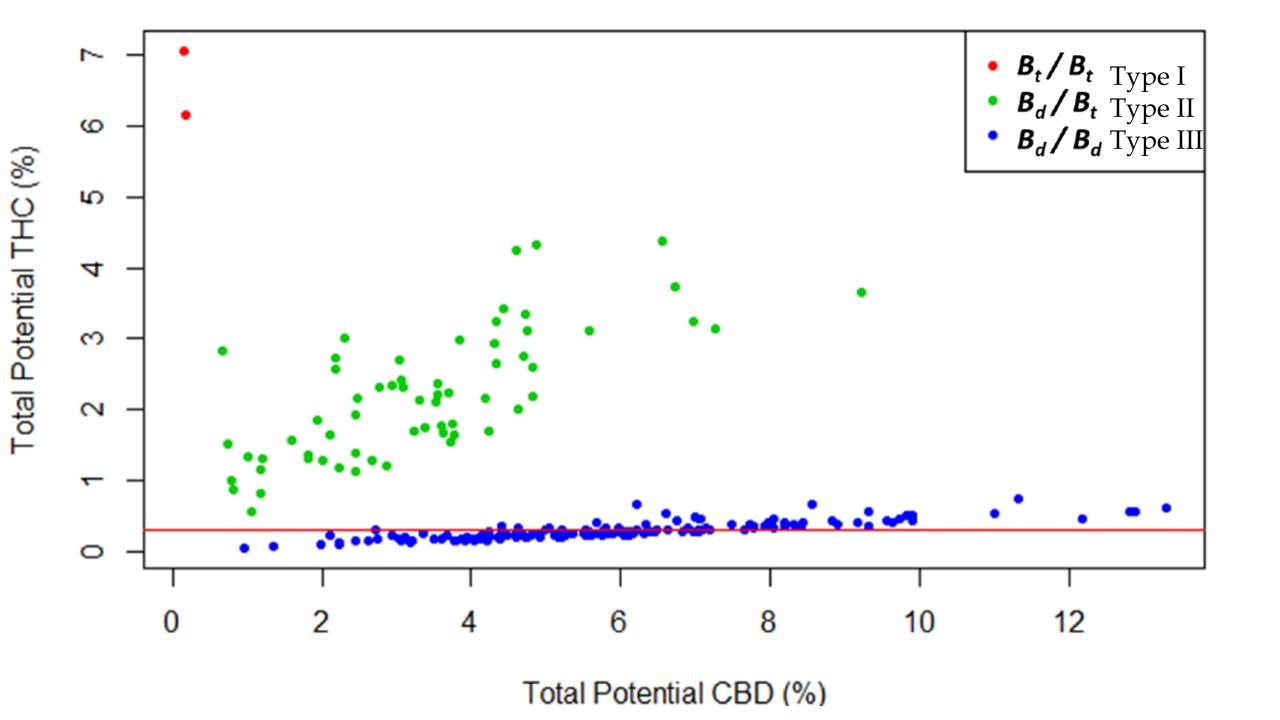

# Cannabinoid biosynthesis

B locus  $[B_t + B_d \text{ alleles}]$ 

# The Regeneration Question 🚱

Wind pollination == major hurdle for regeneration and genetic purity!

Regens must be conducted in isolation; time consuming & expensive

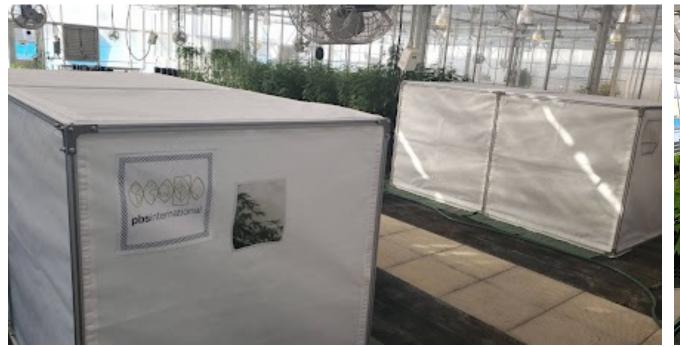

- collaborators!
- positive pressure?
- 10 µm mesh field cages?

# Seed and Pollen Questions 😲

# Germination, dormancy, & pollen

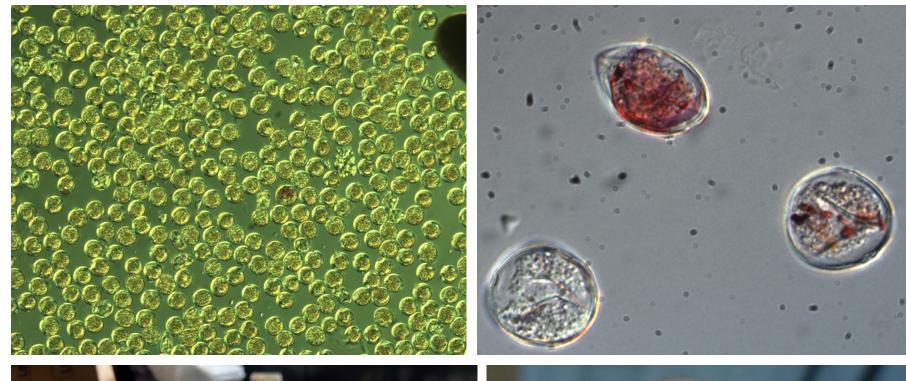

## Pollen:

Capture,
Evaluation,
Storage,
Distribution

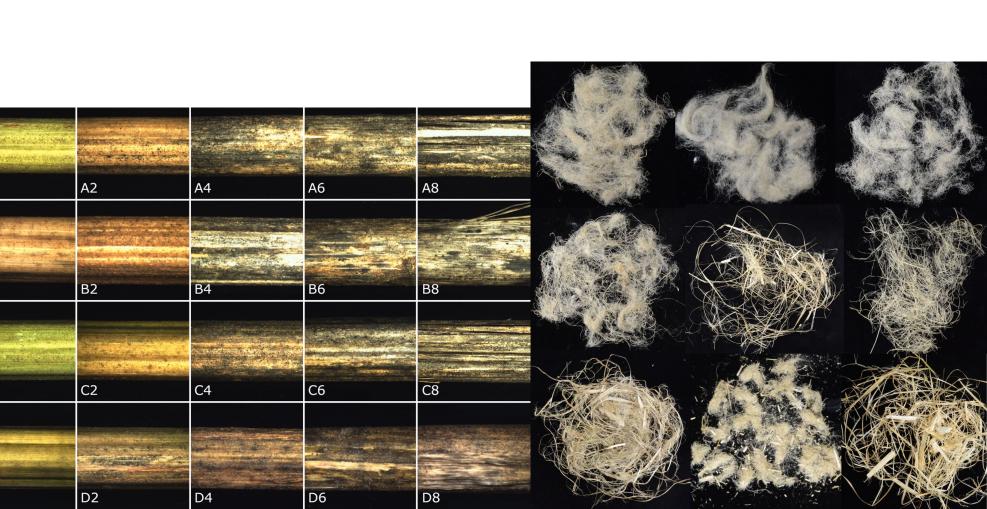

## Hemp pollen

- ~25 μm
- Germinates on Brewbaker-Kwack media
- Sensitive to overdrying
- Storage longevity is unknown

# Evaluating fiber quality

Collaboration with Chris Delhom at SRRC
